

# SATELITE

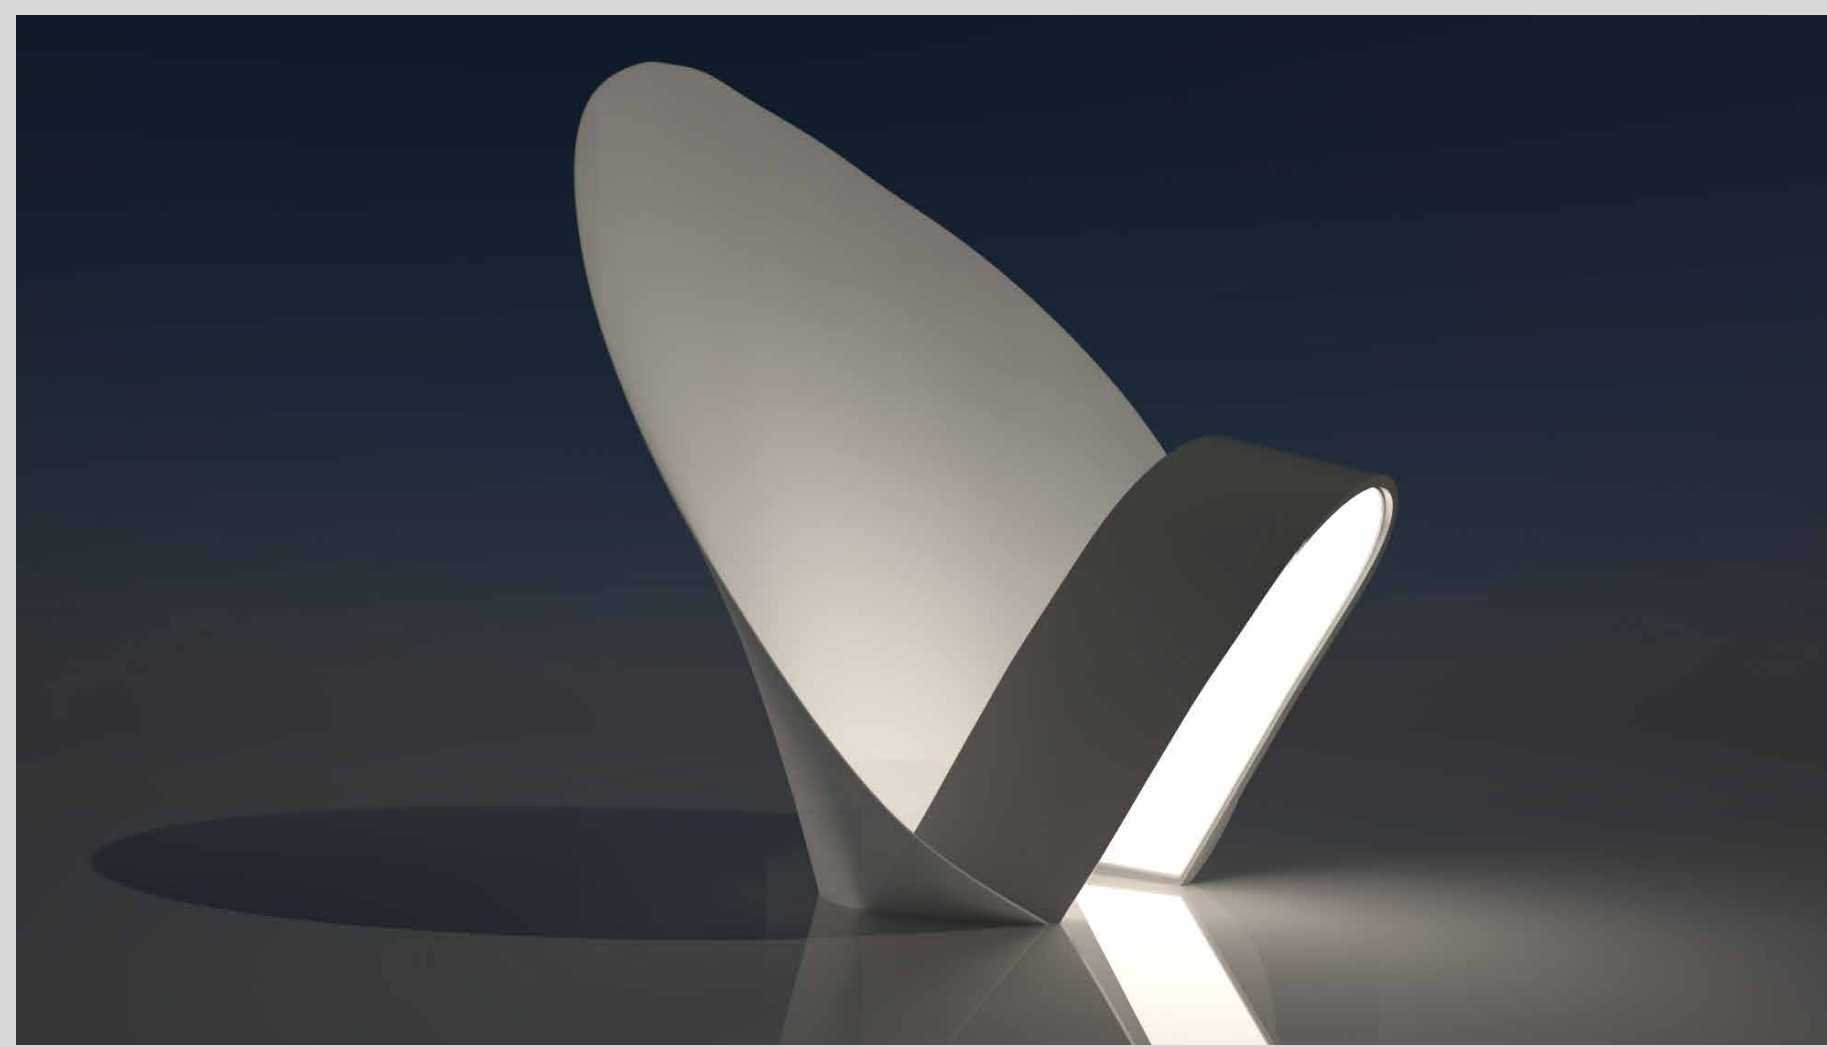

**Satelight** is a concept light for interior use made out of aluminium, rice paper and OLED flexible strip light.

The inspiration of the shape and concept of Satelight derives from satellites transmitting information from the universe into our homes.

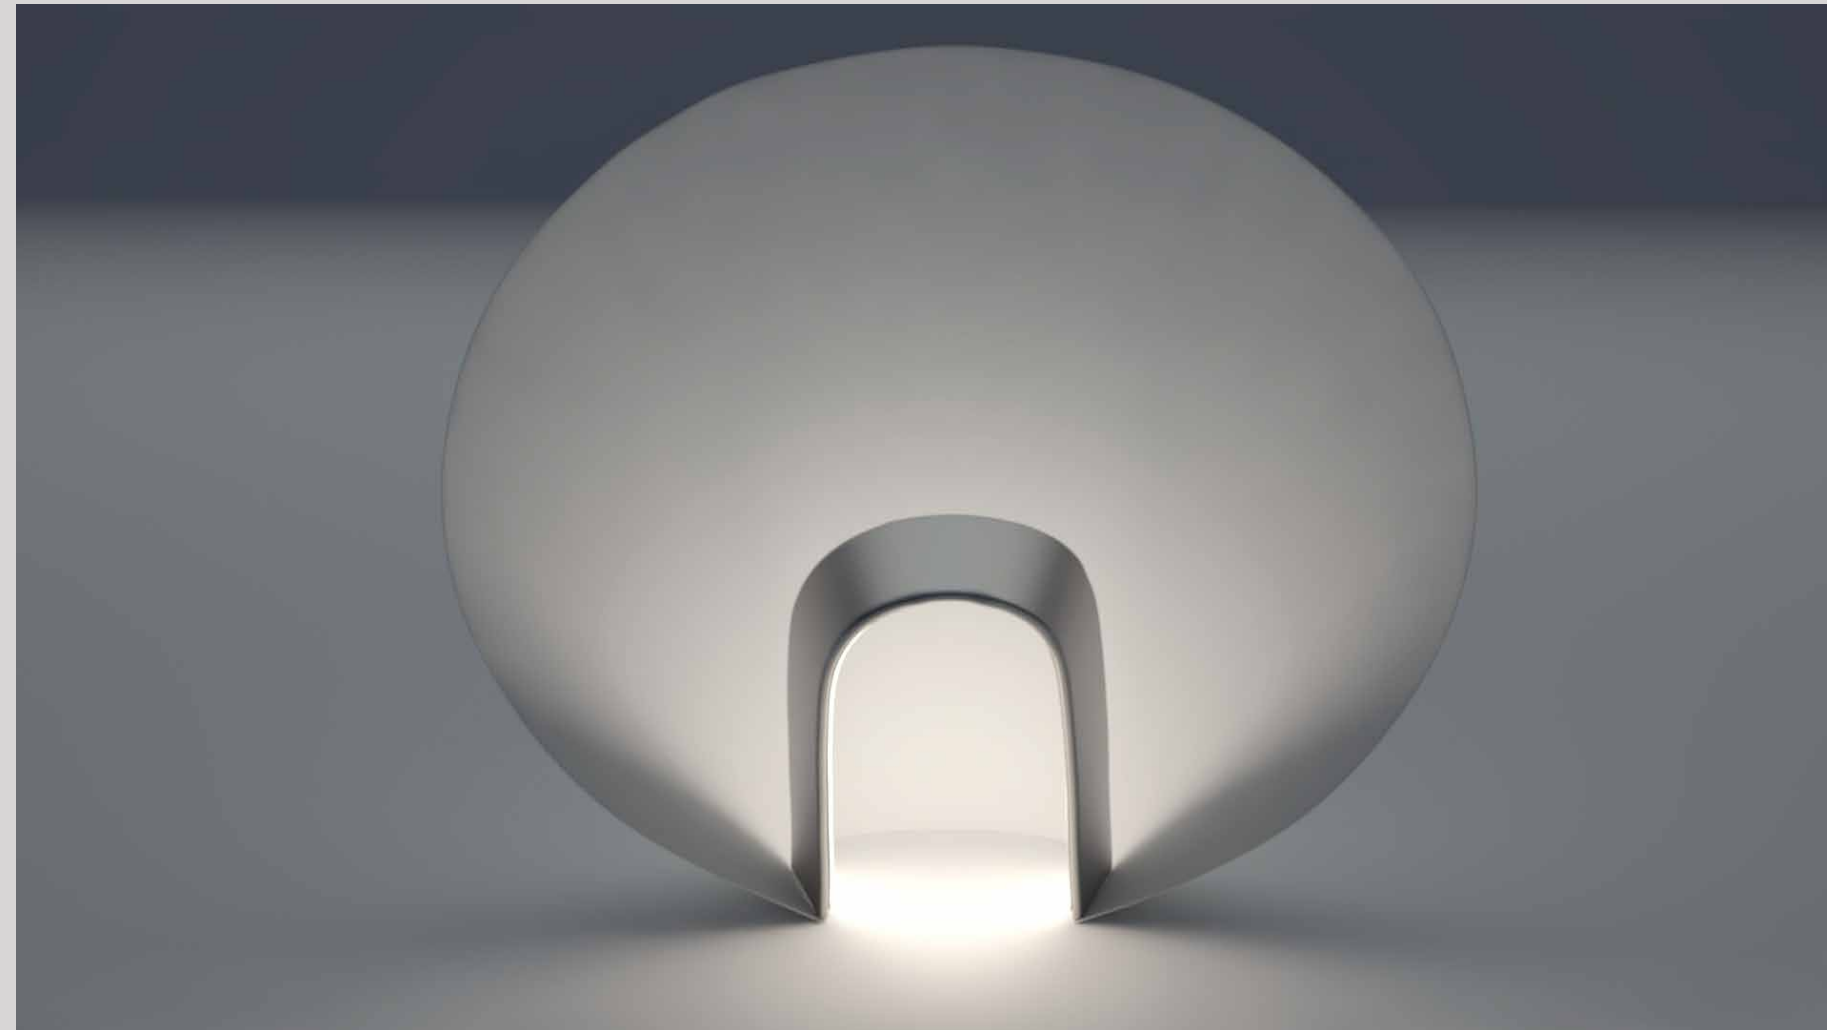

Its a bridge between the future that OLED light brings and the traditional Asian lantern.

» Reflection on the surface where Satellite is placed on

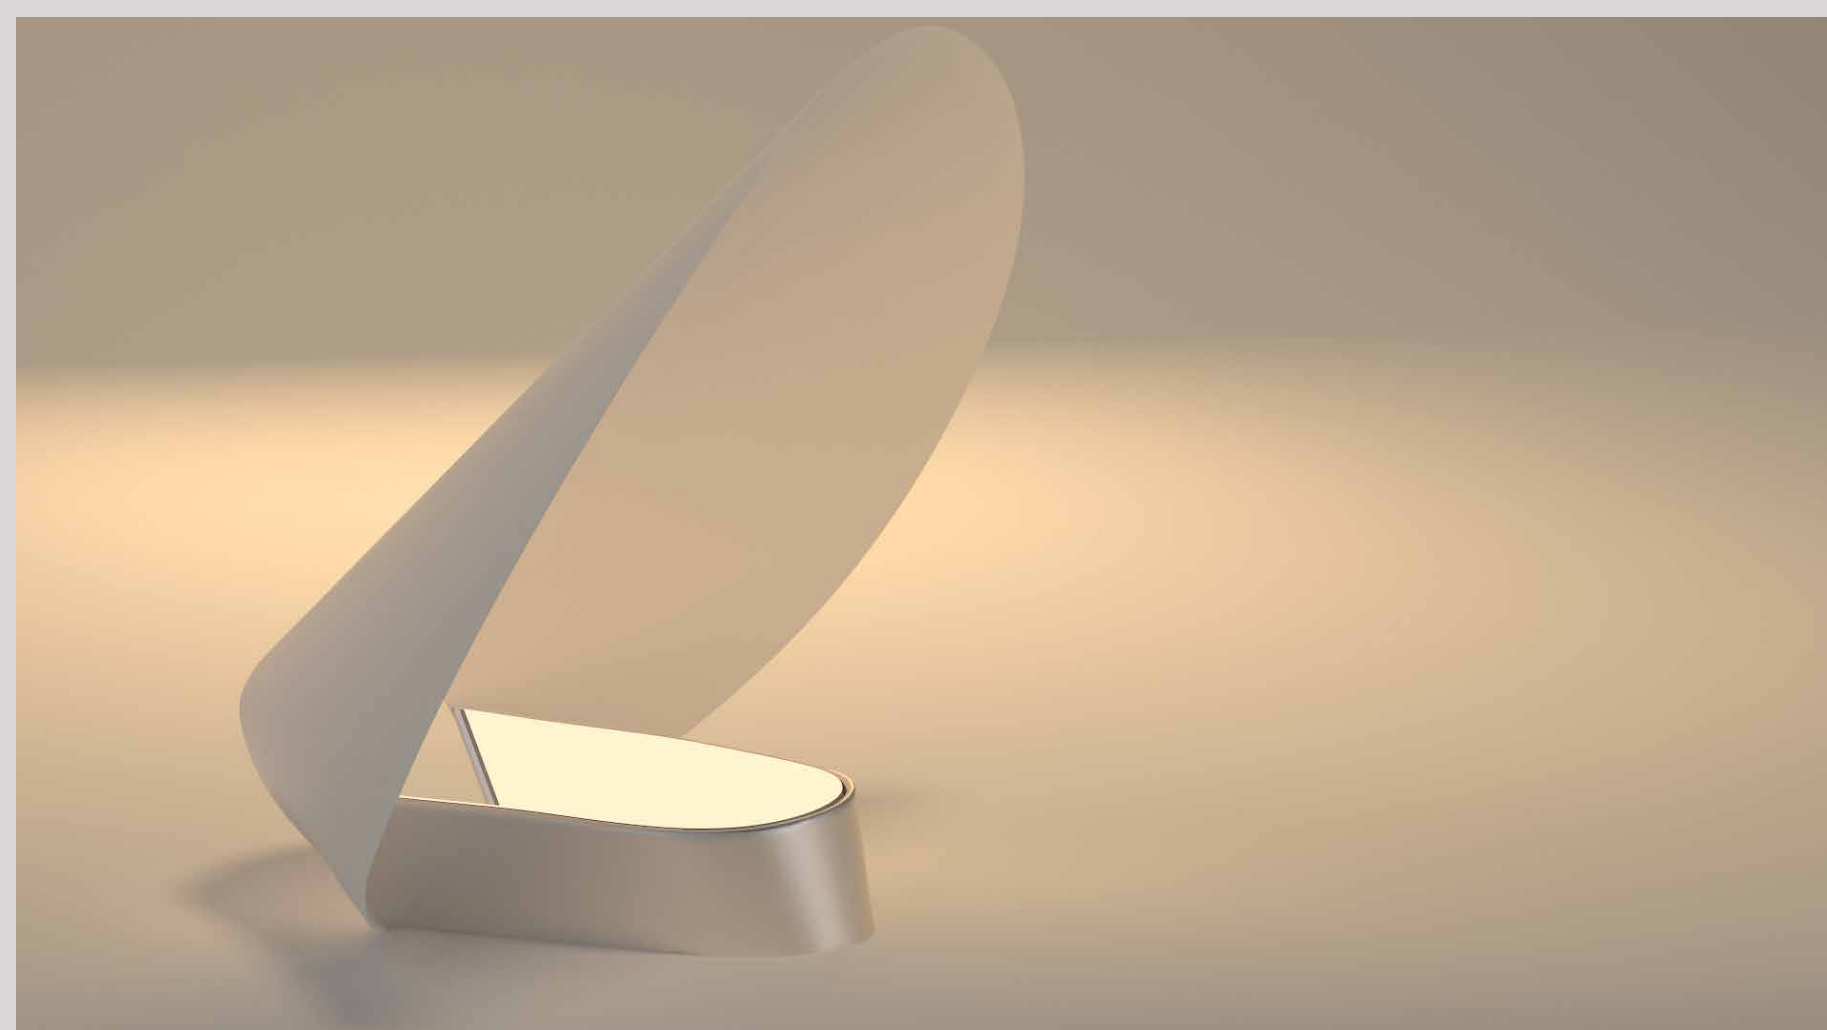

» A play of light and shadow with the curved aluminium

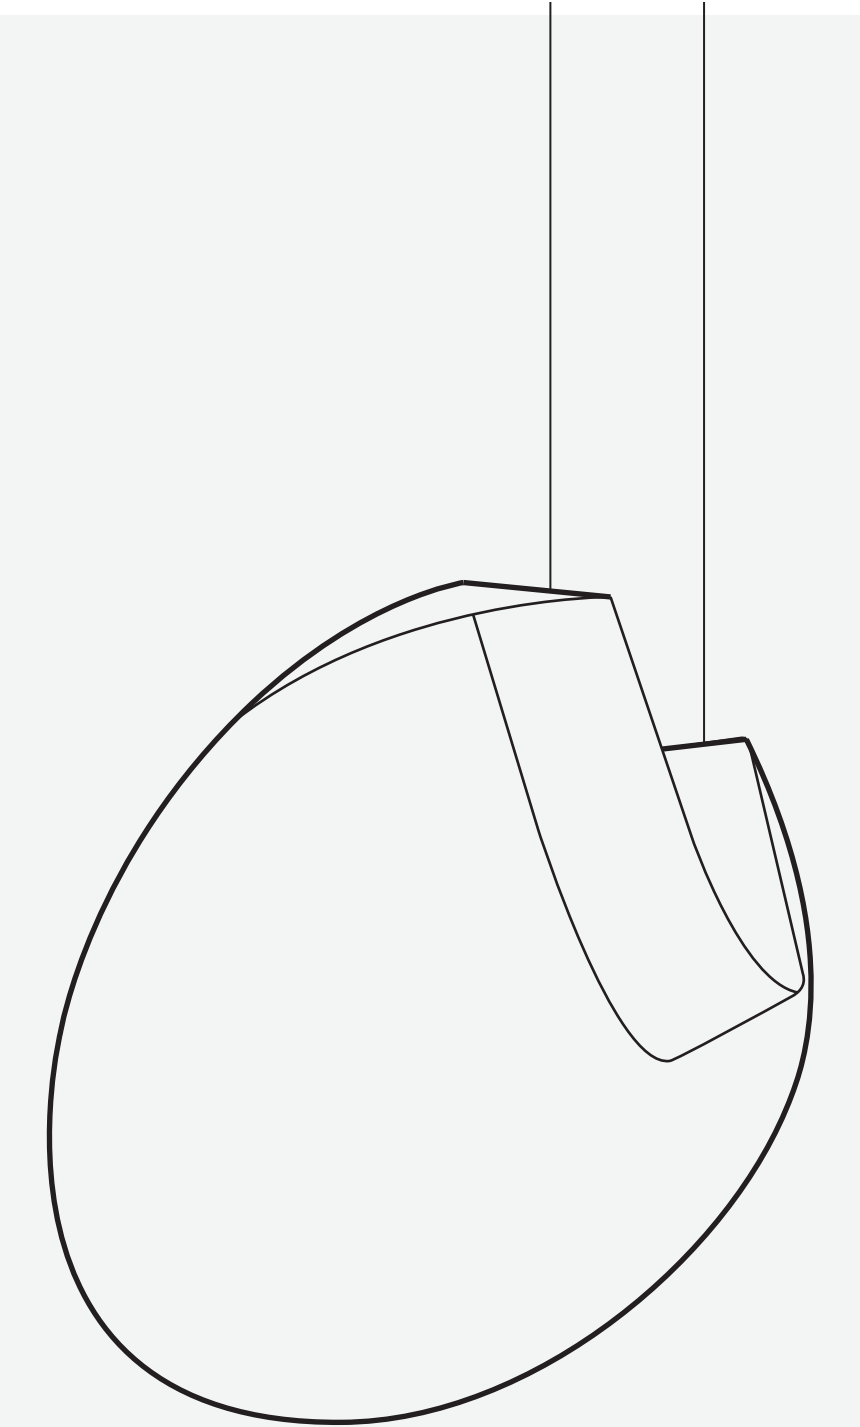

» The warm light of the OLED strip makes the rice paper glow, creating the appearance of a diffused lantern light

» An interesting game between the materials, the weight and the motion

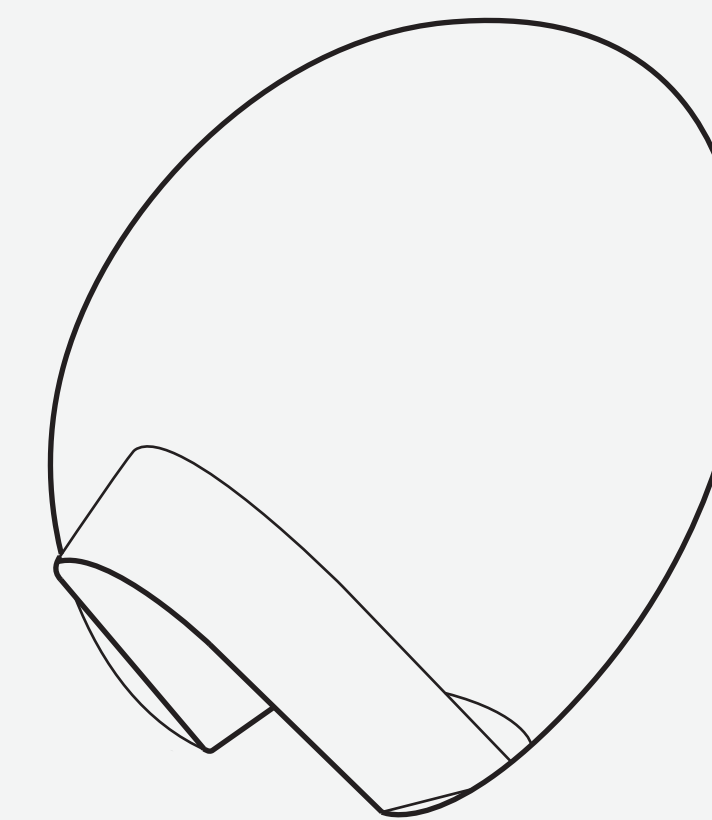

**1.** Hanging from the **ceiling** by two balancing wires that also provide the electricity supply.

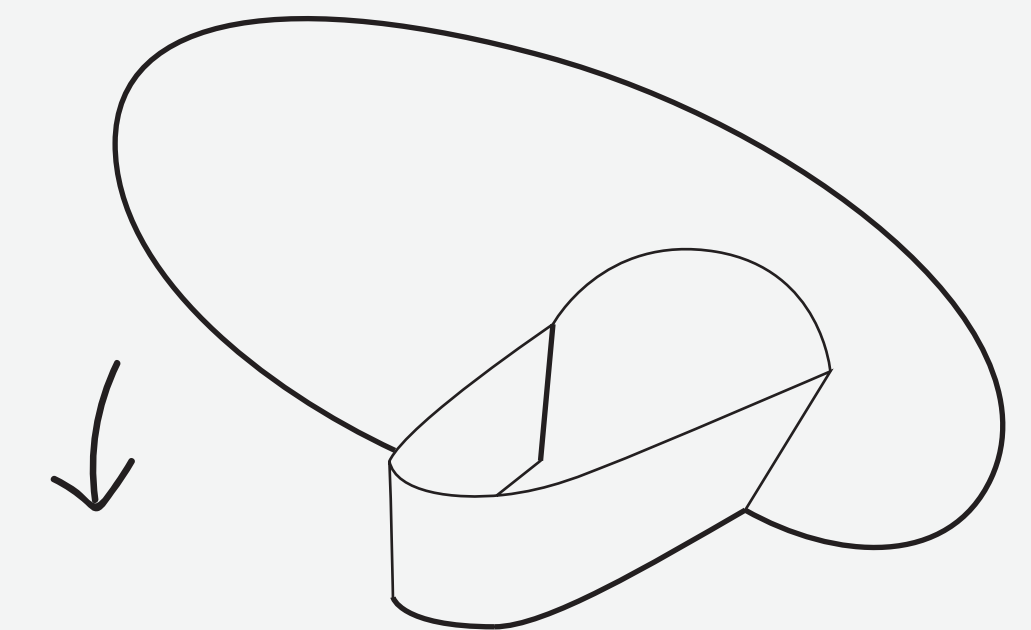

## THREE POSITIONS

**2.** Standing on the **paper** part

**3.** Standing on the **aluminium** part

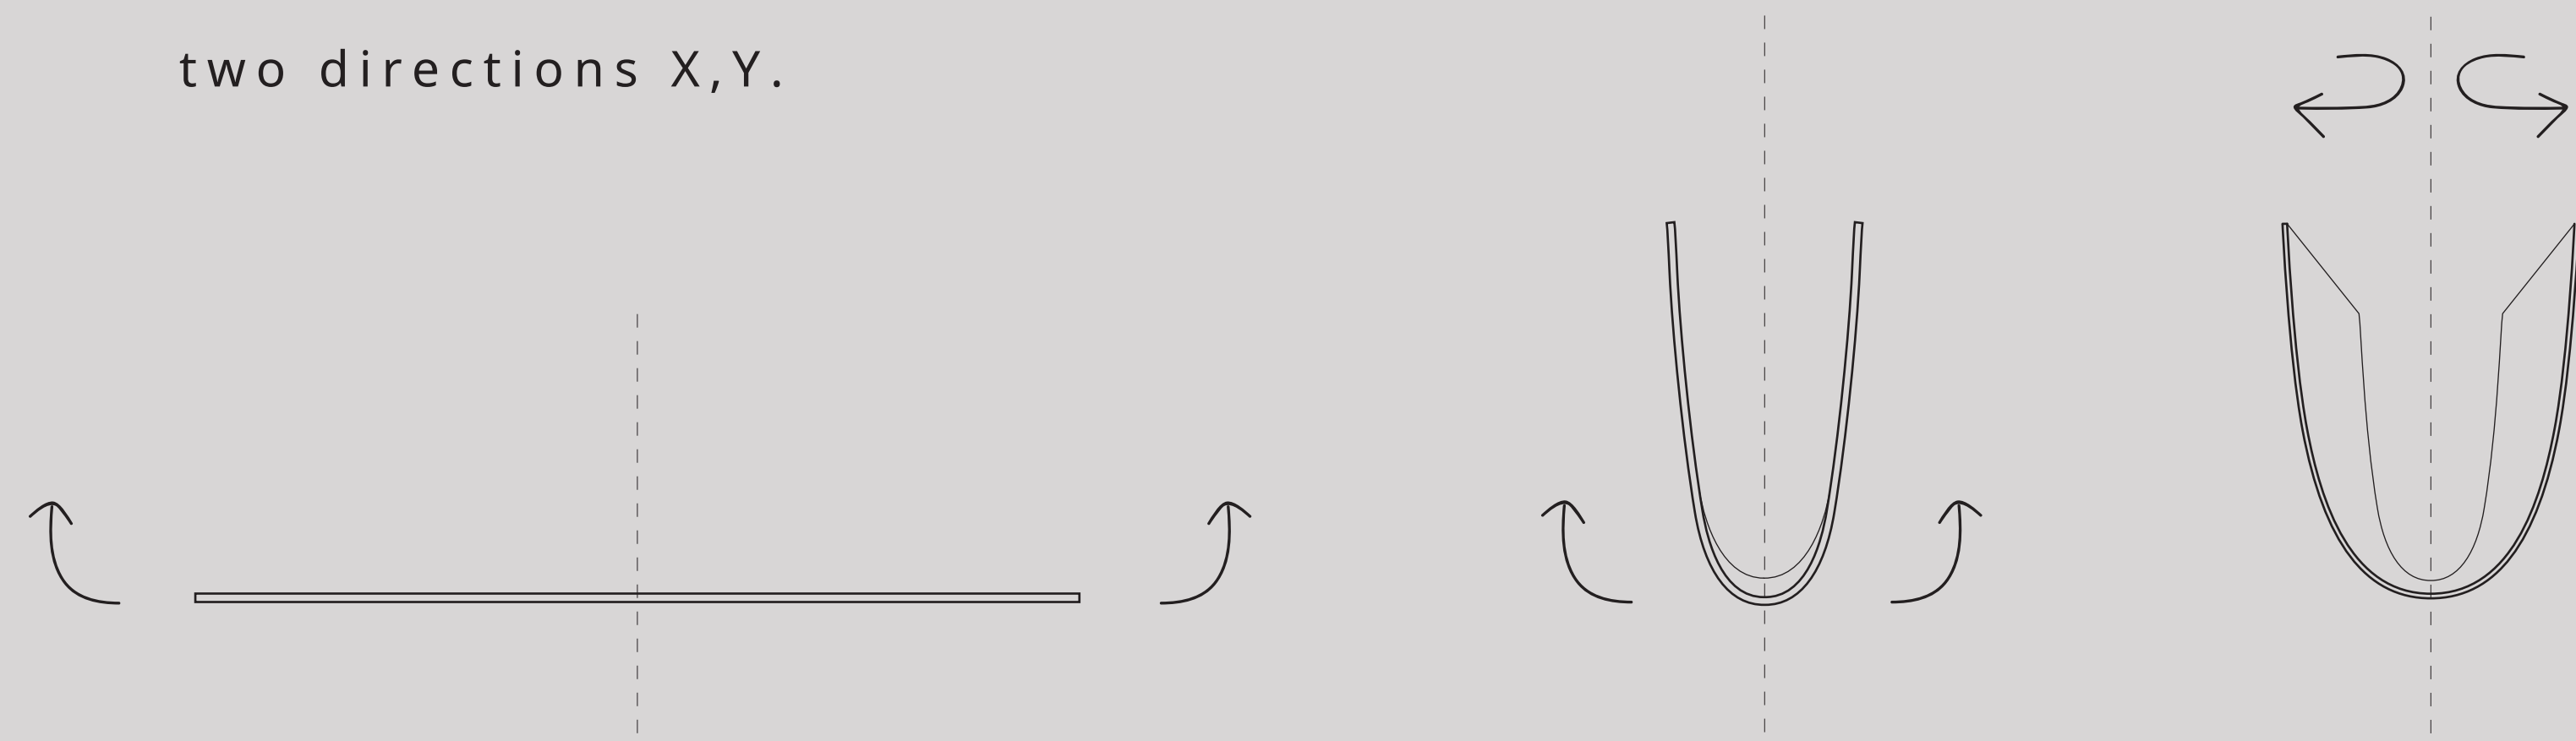

The **OLED** strip becomes the centre of the object and also functions as a **handle**

The capability to **touch** the source of light changes our current perception of the danger of such a move

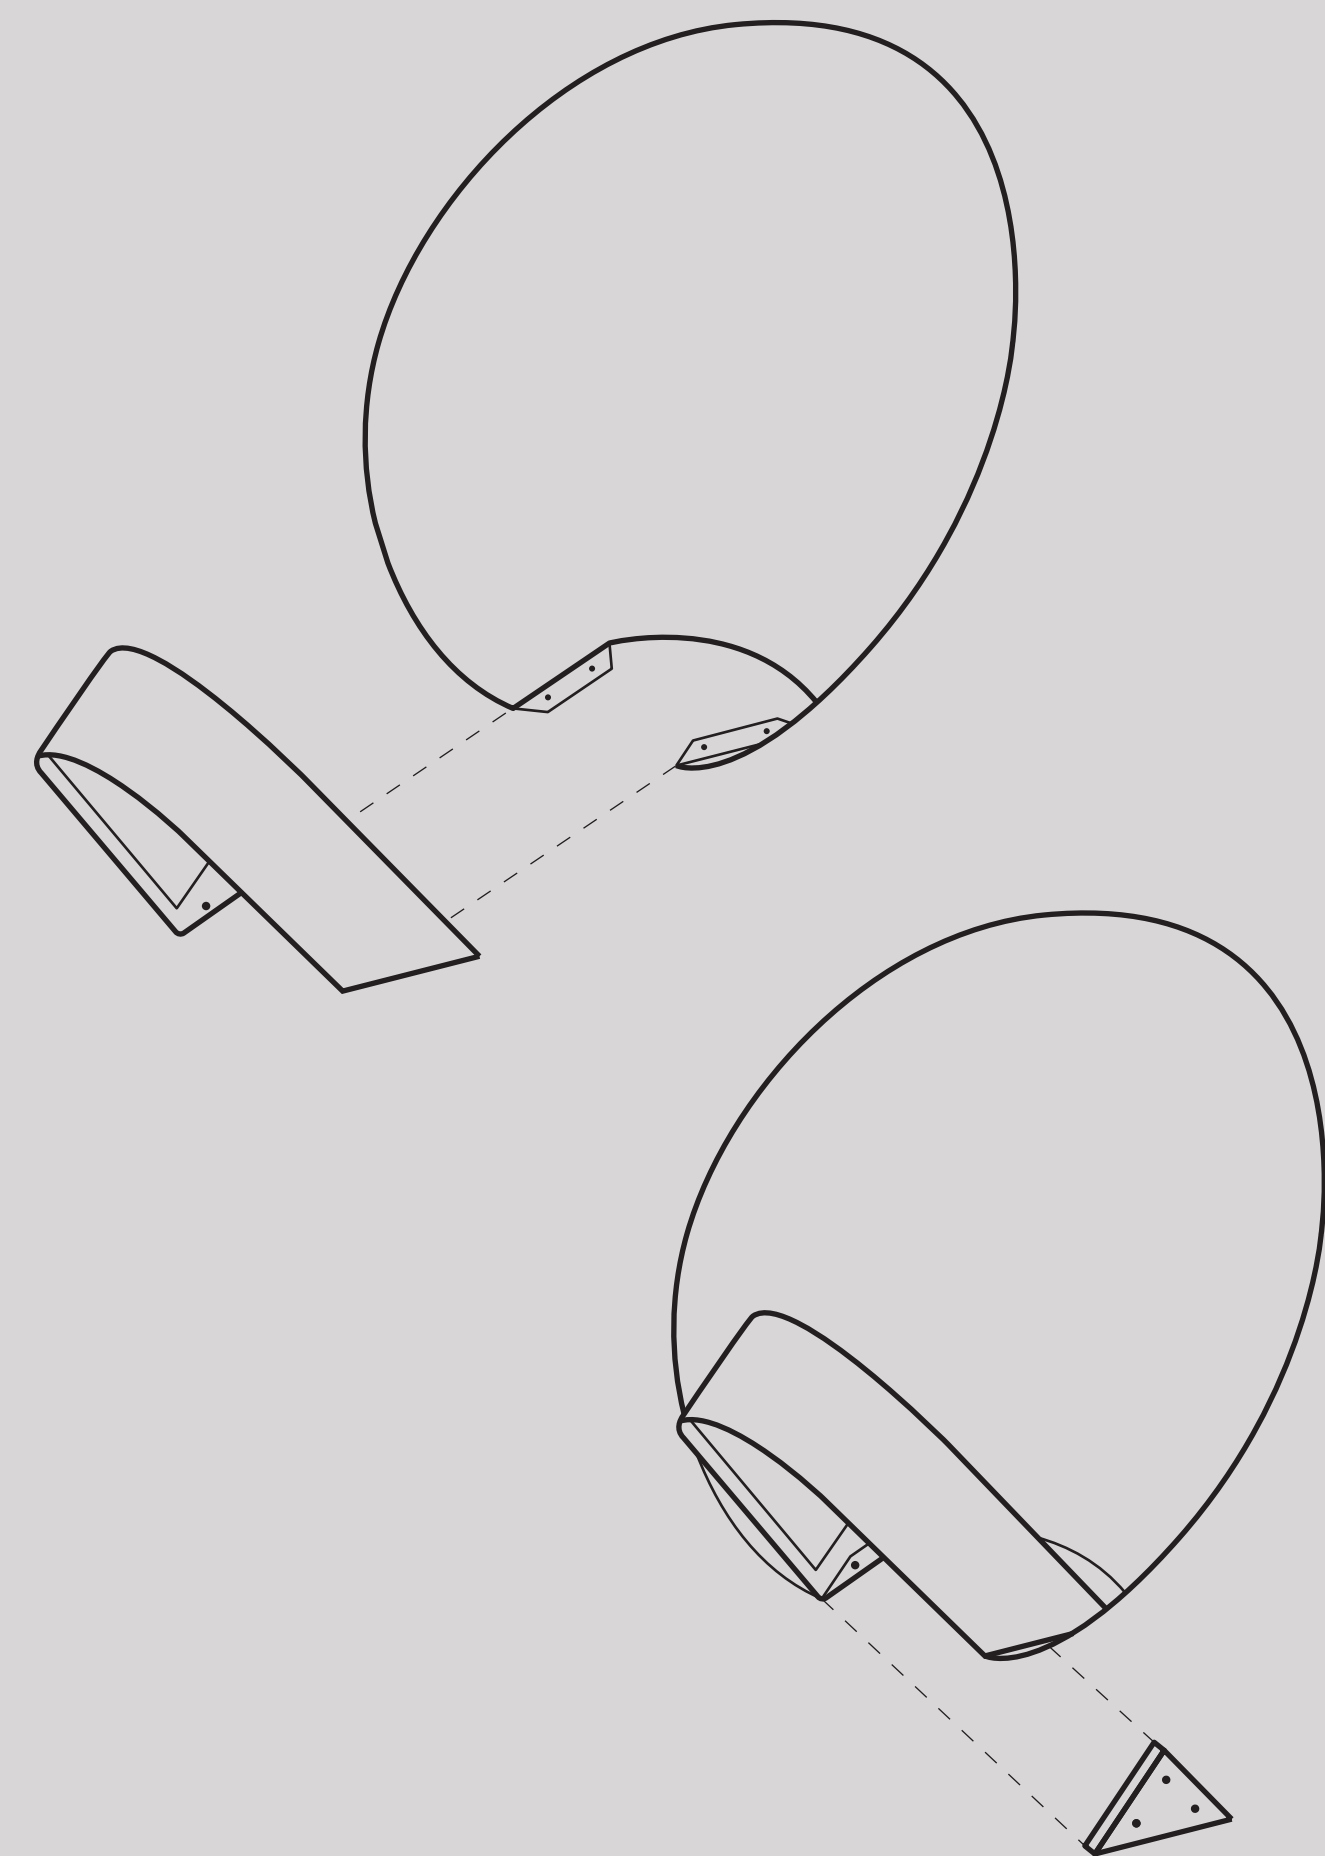

# The emergence of OLED flexibility

Utilising the capability of the material bending into two directions X,Y.

**A.** Connecting folded aluminum part with translucent paper

## ASSEMBLY

**B.** Metal triangle provides both assembly and stability
